Subject: Application for Senior / Lead Data Scientist position

Dear Hiring Team,

I am writing to apply for the **Senior / Lead Data Scientist** position on your team. Over the past five years at **Homiwoo**, a French real-estate data company, I have owned the full model lifecycle from data ingestion and research through Dockerised production serving on MLflow, drift monitoring, and SLA validation. I am looking to bring that experience into a senior role where I can shape both the technical direction and the team culture around it.

The clearest example of production ML ownership is a **subsidiary-housing classifier** I built and shipped at Homiwoo. The model infers subsidy type directly from a real-estate advertisement, using both text and image inputs, and lets investors qualify listings in seconds instead of manual review. Beyond the modelling itself, the interesting engineering was around **production discipline**: SLA acceptance tests as a release gate, drift-detection dashboards so retraining is data-driven rather than calendar-driven, and instrumentation so that any behavioural change can be traced back to a specific data shift or model revision.

A second project I am proud of is a **migration of legacy rule-based expert-system algorithms to ML**. The hard part was not the training. It was proving behavioural parity to stakeholders before cutover. I ran side-by-side consistency and robustness tests on live data, negotiated what "acceptable divergence" meant with the business, and delivered a controlled rollout that reduced years of technical debt without breaking downstream systems that depended on the old rules. That kind of stakeholder-facing ML work, where the modelling is a means and the trust-building is the actual deliverable, is a big part of what I want to do more of.

On the research and development side, I was part of the team on an internal **Computer Vision Innovation project** covering pair image matching, image segmentation, and multi-class classification and identification, deployed behind a Gradio user interface so non-technical stakeholders could probe results directly. Beyond individual projects, I contribute to proofs of concept for the team, coordinate cross-functional contributors, and moderate technical discussions so decisions are made cleanly. I am equally comfortable proposing a new research direction and holding the SLA on a production model overnight.

To stay future-ready, I am actively upskilling in **agentic AI development** and **spec-driven development**, positioning myself to lead teams that build with, and alongside, AI agents rather than only ship classical ML models. The systems thinking above - SLA-gated deploys, drift monitoring, multi-modal fusion, disciplined benchmarking - transfers directly to LLM-in-production work.

I would welcome a conversation about how that mix of research depth, production ownership, team coordination, and forward-looking upskilling could serve your roadmap. My CV is attached, and I am happy to walk through any project in more detail.

Sincerely,

Swathisree Sreepada
